

# Vezni List

**Slovene Lands Gazetteer**

## — “the binding leaf”

Place name in any language → the parish → the registers → the map. About 1900; Carniola · Styria · Carinthia · Littoral · Prekmurje.

### THREE TOOLS, ONE QUESTION

- **Vezni List — the app**
  start here: one search box, one card per place, buttons to the registers and the map
- **The spreadsheet behind it**
  Slovene Lands Place Names 1900.xlsx — the same data, every column; David shares the file when you want to dig
- **This guide**
  how to read a result, how to research with it, what to do when a new version arrives

**“VEZ-nee LEEST” — the endpaper that ties a book to its cover. This app is that leaf, between Tonya and the parish books.**

Built for family research, 2026.

# How to find your family's parish

You have a place name off a family record — in Slovene, German, Italian, Hungarian or an old spelling. Vezni List tells you whose parish registers to open, which years are online, and where the place is. Everything else exists to make that answer trustworthy.

| 10,636 | 5,007 | 4,442 | 1,345 | 25,461 |
|---|---|---|---|---|
| settlements | with a parish | with years online | parishes, 5 archives | names you can type |

### 1 Open Vezni List and type the name

Any language, any spelling, even part of a name: Laibach, Skofja, Caporetto, Bagonya, Jelfha all work and accents do not matter. Results appear as you type.

### 2 Several places? Pick yours by district

Same-named places are shown as one group with a line each — district · commune · province. A record usually names the district too. Tap the line that fits.

### 3 Read the gold PARISH block

That is the register to open. Under it: the years Matricula has online for baptisms, marriages and deaths — then tap “Open on Matricula”.

### 4 Check these too · More Info · the map

“Check these too” lists other parishes worth opening. “More Info” shows everything we know; “Map” draws the country of 1900; “Directory” lists each parish's villages; “Names” holds every name in its colour; “Definitions” explains the words.

### The one mistake that sends you to the wrong records

Never go by the name alone. Brezje is the name of 34 different settlements in 16 districts; one place name in five is shared with somewhere else.

Always check the district and commune against what you know. If you still cannot tell two apart, open both parishes and compare.

# Reading a result in Vezni List

Each place is a card. Top to bottom, this is what every part means and what to do with it.

| What you see | What it means | What to do |
|---|---|---|
| **Names line — Bled · Veldes** | The Slovene, German, Italian and Hungarian names of the place; the one you typed is highlighted. | Make sure it is the place you meant — the next line tells you where it is. |
| **District line — Radovljica district · Bled commune · Carniola** | Where the place sat in 1900. The province is the old crown land; the district is what a record usually names. | This is how you tell one Brezje from another. Match it to what you know. |
| **PARISH (gold block)** | The church that kept the registers, with how far the village was from it, its confession, diocese and the archive that holds the books today. | This is the answer. If the block is grey — “No parish in our books” — read the nearest churches it suggests. |
| **Baptisms · Marriages · Deaths** | The years Matricula has PHOTOGRAPHED for that parish — not every year the parish ever kept. | If your date falls inside, open Matricula; if earlier, look at the mother parish (below). |
| **Open on Matricula** | Opens the parish's register page. “Archive index” means several parishes share the name and the page lists them. | Tap it; the register books are listed by type and year. |
| **Apple Maps / Google Maps** | A pin on the village — or on its parish church when unpinned; the gold block also links the church itself. | Useful to judge distances and neighbours; the parish church is where the family walked on Sundays. |
| **More Info** | Everything we hold for the place — in six groups, including how we identified the parish and how we placed the pin. | Read it when something looks odd, or when you want to know how sure we are. |
| **Check these too** | Other parishes worth opening, in order: where Matricula's own list files the place, parishes that also list it, same-named parishes, the mother parish, the nearest churches. Each with its years and link. When the parish above already holds the registers, the box says so — its leads are for the special cases. | If the first parish has nothing, go down this list before giving up. |
| **How we identified it** | The rule that produced the parish: unique name, name + district, the archive's own village list, the parish before the 1780s… and whether Matricula's list agrees. | “agrees” means two independent sources say the same. “check both” means they differ — open both. |
| **Older books (mother parish)** | The parish this one was carved out of; books from before it existed are there. | If the years online start after your date, look in the mother parish. Not on Matricula? The card says so and points at the nearest parish with records. |

## The list of results

Places whose name IS or BEGINS WITH what you typed come first. Same-named places are one group with a line each — tap a line to open its card. “N more whose name merely contains …” is folded away; open it only if yours is not above. “Parishes carrying this name” are parishes, not villages — including old parish names (Glogoviz finds Blagovica). A town with several parishes lists each parish with its years. When the 1900 census lists a place twice, you see it once, with a note.

THE COLOURS OF THE NAMES **Slovene** **German** **Hungarian** **Italian** **1846 spelling**

# The map of 1900 — and the buttons across the top

Seven buttons sit above the search box — an eighth, My Places, appears once you save a place. Each opens a different door into the same data, and the Map can dress the country four ways.

| | |
|---|---|
| **Guide** | this guide — with the printable PDF at the top of it |
| **Directory** | every parish A–Ž, and under each one the villages whose records its books cover; every name tappable, a filter box narrows the list as you type |
| **Map** | the whole country of 1900 as dots — the card on the right |
| **Sources** | where every number comes from — each book we drew on, how it was read, and how far to trust it |
| **Definitions** | what the words mean — parish, mother parish, diocese, kresija… with their Slovene, German, Italian and Hungarian names |
| **Names** | every name in one alphabet, each language in its colour, parishes as bold blocks with their villages — all tappable, with its own filter box |
| **Data & Updates** | the date of the data on this device, the buttons that fetch a newer copy, and Text Size for bigger letters |
| **My Places** | only after your first save: the places you kept, each with your own note, one tap back to its card — and a download of the list as a spreadsheet |

### At the foot of every card

Save keeps the place in My Places, with a note of your own. Share Link sends a link that opens this very card (Copy Link on a computer). Report a Problem opens an email to David with the place filled in. Your last few searches wait as chips under the empty search box.

### Typed a name and got nothing?

The app offers “Did you mean …” — the closest names it does hold, as gold chips: tap one. Old spellings work too — Bresovshiza finds Brezovica.

### The Map — 7,678 dots make the country

Every placed village and parish is a dot; gold dots are parish churches. Drag to move, pinch or scroll to zoom; names appear as you come closer — Slovene bold, German beneath. Tap any dot and its card opens in the search.

The coastline, today's borders (dashed) and the rivers come from Natural Earth, for bearings only. On a phone or tablet the map fills the screen — tap its first lines to unfold the full explanation.

| | |
|---|---|
| **Lands of 1900** | every village tinted by the crown land the census itself filed it under — Kranjska, Štajerska, Koroška, Primorska, Prekmurje |
| **Carniola 1846** | Freyer's three kresije — the Ljubljana, Novo mesto and Postojna districts of the 1840s — only where his register states the Kreis |
| **Old parishes pre-1780s** | the church map from before Joseph II's reforms: each of Höfler's old parishes in its own colour, its name at the centre |
| **Wall map** | the printed diocesan wall map itself — 27 photographs of a sheet on a wall, stitched and flattened as well as photographs allow; close, never exact — a reference, while the dots carry the answers |

### No boundary is ever invented

A village is coloured only where the census, Freyer or Höfler actually says so — the rest stay grey, and the borders emerge from the dots themselves. One map per era is the dream; these are the first three.

# Four real lookups in Vezni List, start to finish

Every value below is copied straight out of Vezni List — including the two that do not give you an answer, because those matter just as much.

## Blagovica

A village, its parish — and the older books

You typed
**blagovica (or Glogowitz)**

Parish
**Blagovica**

How far
**0 km — the church is in the village**

Baptisms online
**1787–1910**

Marriages / Deaths
**1788–1882 / 1787–1913**

Check these too
**Krašnja — mother parish, 1621–1899**

District
**Kamnik (Carniola)**

From Ljubljana · Maribor
**NE 17 mi / 27 km · SW 48 mi / 77 km**

For a date before 1787 open Krašnja: Blagovica was carved out of it. Type the parish's OLD name — glogoviz — and the same parish comes up: the archive's old books call it that.

## Laibach

A town with twelve parishes

You typed
**laibach**

Result
**Ljubljana · Laibach — 12 parishes**

Each parish
**its own years + Matricula button**

e.g. Sv. Nikolaj
**baptisms 1588–1850 (the cathedral)**

e.g. Sv. Peter
**1629–1915**

e.g. Šentvid
**1662–1923 · older books: Sv. Peter**

District
**Ljubljana (Carniola)**

From Maribor
**SW 65 mi / 104 km**

Pick the parish by the quarter or street on the record. A suburb parish's older books are often in the cathedral or Sv. Peter — the card says “older books: …” beside each one.

## Cilli

One parish — and one to check too

You typed
**cilli**

Result
**Celje · Cilli**

Parish
**Celje - Sv. Danijel**

Baptisms / Deaths
**1618–1917 / 1757–1920**

Check these too
**Šmartno v Rožni Dolini, 1760–1902**

Why
**Šmartno's own village list names Celje**

About the parish
**formerly St. Daniel in Cilli · 18 villages**

District
**Celje (Styria)**

A town's outskirts often belonged to a neighbour parish. “Check these too” is exactly for that — open it with its own button if Sv. Danijel has nothing.

## Woditsche

Not pinned — but its parish church is

You typed
**woditsche**

Result
**Vodiče · Woditsche**

Parish
**Kalobje — 3.5 km**

Baptisms online
**1765–1901**

Marriages / Deaths
**1765–1905 / 1765–1906**

Map buttons
**“Apple Maps · parish church”**

How we identified it
**name + commune + Matricula agree**

District
**Celje (Styria)**

Several villages are called Vodiče, so there is no pin for this one — the map buttons take you to Kalobje's church instead. The parish is certain all the same: two sources agree.

## Reading a card, top to bottom

Names · District · **PARISH** · Years online · More Info · Open on Matricula · Maps · Check these too · How we identified · Mother parish

Gold marks what answers the question. The rest is there to prove the answer is right — and a grey “No parish in our books” is never “we did not look”: it names the nearest churches and, in More Info, which source ran out.

# The spreadsheet behind the app — and the Freyer 1846 tab

Slovene Lands Place Names 1900.xlsx holds exactly what Vezni List shows, plus the machinery. David shares the file whenever you want to sort, filter, compare, or read a whole parish.

| | |
|---|---|
| **Look-up** | one yellow cell: type a name, every matching row appears below with everything known — the app's search, in Excel |
| **Places** | the gazetteer itself: 10,636 settlements, one row each, 44 columns; the answer columns are amber |
| **Every name** | one row for every spelling of every place, every parish name and every 1846 lead (≈25,500) |
| **Parishes** | one row per parish: years, link, its church on the map, mother parish, old names, its own village list |
| **Guide** | this guide, as text |
| **Sources** | where every column came from and how far to trust it |
| **Districts** | every judicial district of 1900 and how many settlements it had |
| **Freyer 1846** | the oldest list — every Carniolan place and its parish in the spelling of the 1840s; leads only |

Columns worth knowing on Places: PARISH · How far to the parish (km) · Confession · Lutheran parish · the three “years online” · Link to the parish on Matricula · Archive · Diocese · How we identified the parish · Villages in this parish · Parish office (address) · Mother parish (older books) · Nearest parish churches · From Ljubljana / From Maribor · Map (Apple/Google) · Province, Commune, Judicial and Political district · Other spellings (1846 marked). The next page explains each.

## Freyer 1846 — what it is, why it is there, how to use it

Heinrich Freyer's 1846 register of every Carniolan place and its parish, read by machine from a Fraktur scan — the only book that names a parish for EVERY Carniolan village, in the spelling of the 1840s (zh = č, fh/sh = š: Jelfha is Jelša).

Use it when Places has no parish for a Carniolan village, or a record's spelling matches nothing. Start at the top — rows are ordered best-checked first (confirmed · likely · ambiguous · unverified) — read the parish, then CONFIRM it on the Look-up tab. Even its best rows agree with the 1937 book only about two times in three: leads, not answers. Its 1846 spellings are already in Places, marked (1846), and his stated Kreis colours the app's map — the “Carniola 1846” view.

## Windows or Mac — the same file

Excel on Windows, Excel on a Mac, Excel on an iPad, LibreOffice, Google Sheets — all open it. Only the keys differ: Ctrl+F to search and Ctrl+Home for the top on Windows; Cmd+F and Cmd+↑ on a Mac. Every data tab is an Excel Table: sort or filter with the header arrows and rows always move together — nothing can be scrambled. Undo a sort with the arrow again, or close without saving.

## Which tab do I actually open?

Look-up for a name — it is the app's search, in Excel. Places when you want to follow a district or commune across rows. Parishes to read everything about one parish — its villages, its mother parish, its old names. Freyer 1846 last, for Carniolan dead ends — it offers leads, not answers. And the Sources tab says where every column came from and how far to trust it.

# What every column means, and why it matters

The columns are in the order you need them: what you type in, then the answer, then the detail that settles an ambiguity.

| Column | What it holds | Why it matters |
|---|---|---|
| **Slovene / German / Italian / Hungarian name** | The place as each language wrote it in 1900. Italian appears for the Littoral — Gorizia, Trieste, Istria. Hungarian for Prekmurje. | Your record may use any one of them. Karfreit, Caporetto and Kobarid are one village; so are Bogojina and Bagonya. |
| **Other Slovene / German spellings** | Variants from the 1890 register, the 1885 district map, and — marked (1846) — the spelling of the 1840s from Freyer's register. | Spelling drifted. An 1840s register says Jelfha, not Jelša; the (1846) forms are what to search in the oldest books. |
| **PARISH — open this one** | The parish whose registers served that village. | This is the answer. It is what Matricula is organised by. |
| **How far to the parish** | Distance from village to parish church, in kilometres — a plain number you can sort on. 0 means the church stood in the village. | A sanity check. If your family lived 2 km away, a parish 30 km off is probably the wrong one. |
| **Confession** | Catholic, or Evangelical (Lutheran). | Lutheran registers are NOT in the Catholic diocesan archives. Getting this wrong means finding nothing. |
| **Lutheran parish (if any)** | Where a village had a Lutheran parish as well. | Mostly Prekmurje, where a large part of the population was Lutheran. |
| **Baptisms / Marriages / Deaths — years online** | The span of registers Matricula has photographed. | Tells you before you click whether the year you need is even there. |
| **Link to the parish on Matricula** | A direct address for that parish's page. Where several parishes share a name it opens the archive index instead of guessing. | Saves hunting through 1,345 parishes by name. If the parish is in Italy or Croatia today there is no Matricula page; the cell names the archive. |
| **Archive holding the registers** | Ljubljana, Maribor or Koper for Slovenia; for parishes now in Italy or Croatia the row names the Gorizia, Trieste, Pazin or Rijeka archive. | Where to write or visit if what you need is not online. |
| **Diocese at the time (c.1900)** | The bishop's territory the parish belonged to when the records were written — Ljubljana, Lavant (Maribor), Seckau (Graz), Gurk, Gorizia… | Not the parish, and not today's map: Koper only became a diocese in 1977. It tells you which old diocesan records and schematisms to look in. |
| **How we identified the parish** | Whether the match was unique, agreed with the commune, or is flagged. | Shows you how much weight the row can bear. “CHECK” means we would rather say it is ambiguous than guess. |
| **From Ljubljana / From Maribor** | Direction and distance as the crow flies, in miles and km — “SW · 58 mi / 94 km”. | Places the village in your head at once, and against the two cities everyone knows. |
| **Map (Apple) / Map (Google) · Latitude / Longitude** | Two clickable map links and the coordinates behind them, from GeoNames. | Accepted only where the name is unique or the district agrees — where several places share a name the row says “not placed” rather than guess. |
| **Province / Commune / Judicial and Political district** | Where the place sat in the administration of the day. | This is what separates one Brezje from the other thirty-three. |

# What if… — the research method and its pitfalls

The situations that actually come up, and what to do about each.

### I cannot find the name at all

Try the other language columns and the “Other spellings” columns — entries marked (1846) are the 1840s spellings. Then try a shorter piece of it: “Sv.”, “Št.” and “Šent-” are the same word. Then the Freyer 1846 tab, which lists Carniola under its old names, best-checked rows first.

### The German name is blank

That is not missing data. The census printed a German name only where a genuinely different one existed — 1,301 of 2,955 Carniolan villages have none. For those, the German-language record simply used the Slovene name, sometimes with a German ending.

### Two places have the same name

Expected — one name in five repeats. Use the district and commune columns. If your record names a nearby town, the “How far to the parish” column will usually settle it.

### The parish block says “CHECK”

It means the name is genuinely ambiguous and we would rather say so than guess. Open each parish named and compare — each has its own button. Guessing sends you to the wrong register.

### The parish block is grey — “No parish in our books”

It says which source ran out — for example “not listed in the 1937 lexicon”. The village had a parish; we simply hold no book that names it yet. The Littoral is lowest: its books sit in Italian and Croatian archives that are not online.

### The years stop before my ancestor

Those are the years Matricula has PHOTOGRAPHED, not everything the parish kept. Older books may sit unfilmed in the diocesan archive. Write to the archive named on the card — and a mother parish's books may reach further back.

### My family was Lutheran

Check the Confession column. Lutheran registers are not in the Catholic diocesan archives, so Matricula will show nothing. For Prekmurje, ask the Evangelical church archive in Murska Sobota.

### The record is in Hungarian, or Latin

Then the family is almost certainly from Prekmurje, which was Hungary until 1919 under the diocese of Szombathely. Look in the Hungarian name column — Bogojina was Bagonya, Bodonci was Bodóhegy — and search the records under that form as well.

### Parish, diocese, archive — which is which?

PARISH is the church that wrote the register — the column that matters. DIOCESE (c.1900) is the bishop's territory it belonged to then. ARCHIVE is who holds the books today: Ljubljana, Maribor or Koper (on Matricula), or the Gorizia, Trieste, Pazin or Rijeka archives for the Littoral.

### The mother parish is not on Matricula

Some cards name a mother parish with no page of its own — we list it because the archive itself points there for the earliest books. The card says so, and points at the nearest parish whose registers ARE online, with the distance. Budanje's mother Vipava is offline; Planina, 3.8 km away, has baptisms from 1738.

# Where it comes from, and how far to trust it

Nothing here is anonymous. Every column can be traced to a printed source and checked against it.

| Source | What it gave | How far to trust it |
|---|---|---|
| **Gemeindelexikon of the 1900 census (Vienna, 1904–1906)** | The place names themselves and the whole administrative hierarchy, for Carniola, Styria, Carinthia and the Littoral. Transcribed by hand by SIstory, so the accents are right. | Authoritative. 100% of the names read off the 1885 district map are present; 92% are confirmed in the 1890 register's own text. |
| **Krajevni leksikon Dravske banovine (Ljubljana, 1937)** | Which parish served each village, the distance to it, and whether that parish was Catholic or Lutheran. | Good — but it covers Yugoslav Slovenia only. Not the Littoral, which was Italy in 1937, and not Austrian Carinthia. |
| **Matricula Online (read August 2026)** | The register year spans for baptisms, marriages and deaths, and the link to each parish — and, for most of the 1,345 parishes across five archives (Ljubljana, Maribor, Koper, Klagenfurt, Graz), the archive's own list of the villages in its books, its old name and its mother parish. | Authoritative for what is ONLINE. Silence means not yet photographed, not that the books are lost. |
| **Special-Orts-Repertorium of Carniola (1890, checked against 1900)** | Alternative spellings, and which village held the school, post office or church. | Supplementary only. 58% of its machine-read rows corroborate, so it is never used as a name authority. |
| **Special-Orts-Repertorium — Küstenland 1894, Steiermark 1893, Kärnten 1883** | Parish seats from the three regional volumes of the same Austrian census series, read from the Austrian National Library's own digitisation; the Littoral volume even names the parish of villages whose church was elsewhere ("Pf. [Fiumicello]"). Littoral 323, Styria 51, Carinthia 106 rows. | Good for what they say: which villages were parish seats. They do not give parish boundaries. Most Littoral parishes are in today's Italy or Croatia and not on Matricula — the row then names the archive that holds the books. |
| **Freyer, Alphabetisches Verzeichniß (Ljubljana, 1846)** | A parish for every Carniolan settlement, the walk to the church in hours and minutes, and both names side by side. 3,349 rows on its own tab, each carrying how well it checks out. | Leads, not answers — the parish stays OUT of the main sheet on purpose. Its spellings, its stated Kreis and its unmatched names ARE in the app: marked (1846), as the map's "Carniola 1846" view, and as "1846 lead" cards. |
| **GeoNames and Wikidata (read August 2026)** | GeoNames and church anchors: pins for 6,342 settlements, distance and direction from Ljubljana and Maribor, the map links. Wikidata: Hungarian names for 133 Prekmurje villages. | Good. Pins kept only where the name is unique or the district or parish distance settles it; 99.3% lie within 5 km of Wikidata's. Hungarian names are crowd-maintained, not a printed gazetteer. |

## Two more layers, behind the map

- Höfler, pre-Josephine parishes (Ljubljana 2017 & 2022) — the church map before Joseph II's 1780s reforms: 148 parishes with their villages. Gives the "Old parish (pre-1780s)" column, many mother parishes, and the map's oldest coloured view.
- Natural Earth (public domain) — the coastline, today's borders and rivers behind the map, for bearings only. No 1900 border is drawn from it: the coloured views tint the villages themselves, and the boundaries emerge from the dots.

## Still missing — worth knowing

- Littoral — 713 settlements still have no parish. The Gorizia, Trieste and Parenzo schematisms would give parish boundaries, which the 1890 Repertorium does not.
- Freyer 1846 is read and repaired, but ~65% accurate at best. Its own appendix was tried as a tiebreaker and is not reliable enough; it is shown as context instead.
- Hungarian names come from Wikidata, not from the printed Magyarország Helységnévtára — worth confirming against it.

# Keeping it current — and who made it

The data keeps improving as more books are read. Here is where things live, how a new version arrives, and what to do.

## Where the tools live

VEZNI LIST (the app) — a web page. On your iPad it is the icon on your home screen; it also opens in Safari at djeppsonbestdayhr.github.io/slovene-gazetteer. Its header shows the date of the data it carries. You never install or copy anything for it — and once opened online it keeps working without a signal.

THE SPREADSHEET — Slovene Lands Place Names 1900.xlsx. Everything the app shows comes from it, and it sits at the same web address as the app; David shares a copy whenever you want it in Excel.

THIS GUIDE — the Guide button inside Vezni List always opens the newest copy; the same PDF sits beside the app on the web.

## When a new version arrives

The app updates itself: David publishes a fresh copy at the same address; next time you open it, the date in the header is newer. Nothing to do. “Data & Updates” on the page shows the data's date — and a “Check for updates now” button when you want to be sure.

The spreadsheet: ask David for a fresh copy any time. If you kept notes in an old copy, tell him first — he will carry them over.

This guide: the Guide button always holds the newest version; the date in the PDF's file name says which is newest.

## If something looks wrong

Tap “More Info” and read “How we identified the parish” — it says how sure we are and which rule was used. “check both” means two sources disagreed: open both. A grey “No parish in our books” is honest, not broken: use the nearest churches and the mother parish. And tap “Report a Problem” at the foot of the card — it opens an email to David with the place already filled in. Every report so far has made the next version better.

## Who made this, and how to check it

Built by David Jeppson with Claude in August–November 2026, for family research — not published by an archive. Every number can be traced: the Sources tab (and the previous page) names each book, how it was read and how far we trust it. Where we were unsure we said so in the row rather than guessing — that is the whole principle. The five Matricula archives (Ljubljana, Maribor, Koper, Klagenfurt, Graz) hold the registers themselves; Matricula Online is where you read them. Vezni List only tells you which book to open.
